

## CAPNOMETRY/CAPNOGRAPHY

---

When available, the use of quantitative CO<sub>2</sub> measurement should be used under the following indications:

- ✓ Intubated patients
- ✓ Severe respiratory distress
- ✓ Hypotensive patients
- ✓ Significant altered mental status (GCS < 10)
- ✓ Severe head injury
- ✓ Suspected sepsis
- ✓ Analgesic
- ✓ As an adjunct to further substantiate the futility of prolonged resuscitative efforts in CPA, a PCO<sub>2</sub> < 10 after 20 minutes of resuscitative efforts predicts non-survivability
